

Admin Web Portal Guide

The full command center — HR, dispatch, accounting, and compliance

SecureOps platform guide · generated May 29, 2026

The Admin Portal is the web command center for SecureOps. It uses a two-tier menu: top tabs group everything into Dispatch, Human Resources, Accounting, Security, Operations, and Settings; the sidebar then lists the pages inside the selected group. A banner at the top flags any critical configuration issues (such as missing email or an insecure session secret).

1 Signing in and navigating

1 Log in

Enter your email and password. If two-factor is enabled, you'll then enter a TOTP code or a recovery code.

2 Find your way around

Use the top tabs to choose a work area, then the sidebar to open a specific page. Watch the top banner for configuration warnings.

3 Secure your account

Under Settings !' My 2FA, set up or reset your own two-factor authentication.

2 HR pipeline — applicant to active officer

1 Public application

Candidates apply through the public Apply page (personal details, licenses, document uploads). You can share this link directly.

2 Review applications

On Applications, search and filter submissions, then open one to Approve, Reject, or Request more info. Requesting info emails the applicant an amendment link to fix specific fields via the Amend page — no full resubmission needed.

3 Approve

Approving automatically creates the user and employee record and generates a temporary password, then issues an onboarding link.

4 Onboarding

Onboarding tracks approved candidates who still need to finish their profile (bank details, tax, uniform sizes, policy signatures). Resend the link if it expires.

5 Invitations

Use Invitations to generate temporary passwords in bulk and email sign-in invites — useful for staff who skip the public form. Admins are never targeted by bulk actions.

3 Personnel and compliance

1 Personnel roster

See your whole roster, with on-duty officers highlighted by a live green pulse and last-ping time. Click an officer to open their full profile — contact info, documents, and live GPS location.

2 Compliance check

On Compliance, select a site to see which officers are compliant versus which have gaps (e.g., missing First Aid or firearms training) against that site's requirements.

3 License renewals

Work the License Renewals queue to review and verify expiring security licenses.

4 Dispatch and staffing

1 Dispatch command center

The live-ops hub combines a real-time map of clocked-in officers and active incidents, a live incident list (click to add notes or change status), and an Open Shifts panel for the next 72 hours.

2 Assign nearest

On an open shift, use "Assign Nearest" to see qualified officers ranked by distance and assign one with a single click.

3 Plan staffing

Use Staffing's calendar view to manage events and shifts, including repeating shift series for long-term contracts.

4 Approve swaps

Review and approve shift trades between officers on Swap Requests.

5 Time, payroll, and invoicing

1 Approve time

Review and approve or reject clock-in/out records. Approval drives both payroll and invoicing.

2 Payroll Board and Pay Run

The Payroll Board summarizes pending pay; from there run a Pay Run to preview, export the ACH/CSV batch, and mark officers paid.

3 Invoice Board

Client invoices are auto-built from approved hours at each site's bill rate. Track Draft, Sent, and Paid statuses and generate or adjust as needed.

DEEP DIVE

The end-to-end payroll and invoice logic is documented separately in the "Payroll & Invoicing Process" PDF.

6 Operations — data management

1 Generic tables

The Operations tables manage core data (Clients, Sites, Shifts, Users). Search, filter, and add or edit rows through dynamic dialogs.

2 Bulk import

Use the Import Wizard to upload spreadsheets (.xlsx) and map columns to the right fields for bulk creation.

3 Site detail

Open a site from the Sites table to see its parent client, all its shifts and assigned staff, and to set a custom geofence radius overriding the global default.

7 Communication, reports, and sharing

1 Chat and Radio

Message individuals or groups in real time on Chat, and use Radio for push-to-talk style voice transmissions.

2 Daily reports

Daily Reports is a searchable archive of the DARs officers submit at the end of their shifts.

3 Secure share links

Generate expiring, no-login links to share a specific incident or employee profile with outside parties (e.g., a client manager or insurance adjuster).

8 Security, audit, and exports

1 Audit log

Under Security, search the audit log to see every privileged change — who did what, and when.

2 System status

The configuration banner and security settings surface missing email/SMTP, weak session secrets, and other deployment requirements.

3 Exports

Use Exports to pull data out of the system for reporting or record-keeping.
